

Energy Conservation and Construction: Will we all be living in the Dark?

Building codes have existed since the times of the ancient Greeks. Until recently, codes have focused on issues of health and safety and are largely driven by past failures in construction. Only in the last couple decades have building codes started delving into the issue of energy use and conservation.

This session will discuss how this affects builders, why we should care and how to meet the requirements of the IECC (International Energy Conservation Code) without breaking the bank.
